**Practice Work – 1: User input validation**
January 28, 2015

1. Place four textboxes on your html file.
Textbox 1 for name of the user
Textbox 2 for email address
Textbox 3 for password
Textbox 4 for password to be entered for second time.

2. Place one button on your html file.

3. Define the click action for the button.  Event handler should be attached to the click event in JS code, not within HTML code. When the button is clicked following checks should be conducted on input fields:

- All fields are mandatory, they all have to be filled.
- Email field should have a valid email address (hint: should have @ sign in it)
- Two passwords should match.

4. All javascript code should be written within an external JS file.

What to turn in:

.html file and .js file should be submitted through eLearning.
